will Benefit your*

Lower manufacturing costs, increased output and “lights out” manufacturing capability are all benefits been seen by a major player in the defence sub-contractor market following installation of a material handling system by CPR Automation.

The new equipment from CPR replaces up to three operators with an advanced bowl feeder and pick and place arm in the automation of a lathe based turning operation. The components produced by the lathe are manufactured to close tolerances and in difficult to machine materials with no room for loading errors.

The system from CPR is noteworthy for its fitment to an existing machine tool which has further increased the financial benefits for the user and again demonstrates CPR’s flexibility in partnering with its customers to get the best out of a manufacturing process.
